BENZIMIDAZOLE DERIVATIVES, COMPOSITIONS CONTAINING THEM,
PREPARATION THEREOF AND USES THEREOF

BACKGROUND OF THE INVENTION

5 1. Field of the invention

 The invention is related to therapeutic compounds which are CB₁ receptor ligands, pharmaceutical compositions containing these compounds, manufacturing processes thereof and uses thereof, and more particularly to compounds that are CB₁ receptor agonists. More particularly, the present invention is related to compounds that may be effective in treating
10 pain, cancer, multiple sclerosis, Parkinson's disease, Huntington's chorea, Alzheimer's disease, anxiety disorders, Gastrointestinal disorders and cardiovascular disorders.

2. Discussion of Relevant Technology

 Pain management has been an important field of study for many years. It has been well known that cannabinoid receptor (e.g., CB₁ receptor, CB₂ receptor) ligands including
15 agonists, antagonists and inverse agonists produce relief of pain in a variety of animal models by interacting with CB₁ and/or CB₂ receptors. Generally, CB₁ receptors are located predominately in the central nervous system, whereas CB₂ receptors are located primarily in the periphery and are primarily restricted to the cells and tissues derived from the immune system.

20 While CB₁ receptor agonists, such as Δ^9 -tetrahydrocannabinol (Δ^9 -THC) and anadamide, are useful in anti-nociception models in animals, they tend to exert undesired CNS side-effects, e.g., psychoactive side effects, the abuse potential, drug dependence and tolerance, etc. These undesired side effects are known to be mediated by the CB₁ receptors located in CNS. There are lines of evidence, however, suggesting that CB₁ agonists acting at
25 peripheral sites or with limited CNS exposure can manage pain in humans or animals with much improved overall in vivo profile.

 Therefore, there is a need for new CB₁ receptor ligands such as agonists, antagonists or inverse agonists that are useful in managing pain or treating other related symptoms or diseases with reduced or minimal undesirable CNS side-effects.

30 DISCLOSURE OF THE INVENTION

 The present invention provides CB₁ receptor ligands which are useful in treating pain and other related symptoms or diseases.

by, for example, stirring. The molten homogeneous mixture is then poured into convenient sized moulds and allowed to cool and solidify.

Suitable carriers are magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter, and the like.

The term composition is also intended to include the formulation of the active component with encapsulating material as a carrier providing a capsule in which the active component (with or without other carriers) is surrounded by a carrier which is thus in association with it. Similarly, cachets are included.

Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

Liquid form compositions include solutions, suspensions, and emulsions. For example, sterile water or water propylene glycol solutions of the active compounds may be liquid preparations suitable for parenteral administration. Liquid compositions can also be formulated in solution in aqueous polyethylene glycol solution.

Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavoring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical formulation art.

Depending on the mode of administration, the pharmaceutical composition will preferably include from 0.05% to 99%w (per cent by weight), more preferably from 0.10 to 50%w, of the compound of the invention, all percentages by weight being based on total composition.

A therapeutically effective amount for the practice of the present invention may be determined, by the use of known criteria including the age, weight and response of the individual patient, and interpreted within the context of the disease which is being treated or which is being prevented, by one of ordinary skills in the art.

Biological Evaluation

hCB₁ and hCB₂ receptor binding

- 20 -

Human CB₁ receptor from Receptor Biology (hCB₁) or human CB₂ receptor from BioSignal (hCB₂) membranes are thawed at 37 °C, passed 3 times through a 25-gauge blunt-end needle, diluted in the cannabinoid binding buffer (50 mM Tris, 2.5 mM EDTA, 5 mM MgCl₂, and 0.5 mg/mL BSA fatty acid free, pH 7.4) and aliquots containing the appropriate amount of protein are distributed in 96-well plates. The IC₅₀ of the compounds of the invention at hCB₁ and hCB₂ are evaluated from 10-point dose-response curves done with ³H-CP55,940 at 20000 to 25000 dpm per well (0.17-0.21 nM) in a final volume of 300 µl. The total and non-specific binding are determined in the absence and presence of 0.2 µM of HU210 respectively. The plates are vortexed and incubated for 60 minutes at room temperature, filtered through Unifilters GF/B (presoaked in 0.1% polyethyleneimine) with the Tomtec or Packard harvester using 3 mL of wash buffer (50 mM Tris, 5 mM MgCl₂, 0.5 mg BSA pH 7.0). The filters are dried for 1 hour at 55 °C. The radioactivity (cpm) is counted in a TopCount (Packard) after adding 65 µl/well of MS-20 scintillation liquid.

hCB₁ and hCB₂ GTPγS binding

Human CB₁ receptor from Receptor Biology (hCB₁) or human CB₂ receptor membranes (BioSignal) are thawed at 37 °C, passed 3 times through a 25-gauge blunt-end needle and diluted in the GTPγS binding buffer (50 mM Hepes, 20 mM NaOH, 100 mM NaCl, 1 mM EDTA, 5 mM MgCl₂, pH 7.4, 0.1% BSA). The EC₅₀ and E_{max} of the compounds of the invention are evaluated from 10-point dose-response curves done in 300µl with the appropriate amount of membrane protein and 100000-130000 dpm of GTPγ³⁵S per well (0.11 –0.14 nM). The basal and maximal stimulated binding is determined in absence and presence of 1 µM (hCB₂) or 10 µM (hCB₁) Win 55,212-2 respectively. The membranes are pre-incubated for 5 minutes with 56.25 µM (hCB₂) or 112.5 µM (hCB₁) GDP prior to distribution in plates (15 µM (hCB₂) or 30 µM (hCB₁) GDP final). The plates are vortexed and incubated for 60 minutes at room temperature, filtered on Unifilters GF/B (presoaked in water) with the Tomtec or Packard harvester using 3 ml of wash buffer (50 mM Tris, 5 mM MgCl₂, 50 mM NaCl, pH 7.0). The filters are dried for 1 hour at 55 °C. The radioactivity (cpm) is counted in a TopCount (Packard) after adding 65 µl/well of MS-20 scintillation liquid. Antagonist reversal studies are done in the same way except that (a) an agonist dose-response curve is done in the presence of a constant concentration of antagonist, or (b) an antagonist dose-response curve is done in the presence of a constant concentration of agonist.

Based on the above assays, the dissociation constant (K_i) for a particular compound of the invention towards a particular receptor is determined using the following equation:

- 21 -

$$K_i = IC_{50} / (1 + [rad] / K_d)$$

Wherein IC_{50} is the concentration of the compound of the invention at which 50% displacement has been observed;

[rad] is a standard or reference radioactive ligand concentration at that moment; and

5 K_d is the dissociation constant of the radioactive ligand towards the particular receptor.

Using above-mentioned assays, the K_i towards human CB_1 receptors for compound 1 (scheme 1) of the invention is measured to be about 34 nM. The K_i towards human CB_2 receptors for compound 1 (scheme 1) of the invention is measured to be about 33 nM.

Step C. 4-[(Cyclohexylmethyl)amino]-3-nitro-*N,N*-bis(2,2,2-trifluoroethyl)benzamide

4-Fluoro-3-nitro-*N,N*-bis(2,2,2-trifluoroethyl)benzamide (107 mg, 0.307 mmol) and cyclohexylmethylamine (0.050 mL, 0.368 mmol) were stirred in 3 mL of EtOH containing TEA (0.065 mL, 0.460 mmol) at 75°C for 3h. The mixture was concentrated. The residue was re-dissolved in EtOAc and washed with 5% KHSO₄ solution, saturated NaHCO₃ solution,

brine and dried over anhydrous MgSO_4 . The title product was purified by flash chromatography using 9:1 / hexanes:EtOAc. Yield: 113 mg (83%). ^1H NMR (400 MHz, CDCl_3) δ 1.05 (m, 2H), 1.24 (m, 4H), 1.69 (m, 2H), 1.75 (m, 2H), 1.83 (m, 1H), 3.17 (t, $J = 6.64\text{ Hz}$, 2H), 4.23 (q, $J = 8.53\text{ Hz}$, 4H), 6.91 (d, $J = 8.98\text{ Hz}$, 1H), 7.51 (d, $J = 8.89\text{ Hz}$, 1H), 8.28 (s, 1H), 8.39 (s, 1H).

Step D. 3-Amino-4-[(cyclohexylmethyl)amino]-*N,N*-bis(2,2,2-trifluoroethyl)benzamide

4-[(Cyclohexylmethyl)amino]-3-nitro-*N,N*-bis(2,2,2-trifluoroethyl)benzamide (110 mg, 0.249 mmol) was dissolved in 15 mL of EtOAc containing a catalytic amount of 10%Pd/C. The solution was shaken in a Parr hydrogenation apparatus under H_2 atmosphere (40 psi) overnight at rt. The solution was filtered through Celite and the solvent concentrated. The title product was used directly for the next step without further purification. Yield: 102 mg (99%). MS (ESI) ($\text{M}+\text{H}$) $^+$ 411.9.
